

Improvement for EDTC: 6930 project

The website appeared appealing to me even though it was my first project in graduate school. However there are things I would like to improve in the project given a second chance. These include:

1. The flash animation project.

There was no menu on the in the flash animation page. All other pages in the website had This menu gave the users easy time to navigate the website. Including the menu page in the on the flash animation project would be one of the major improvement on the project. The color of the Flash animation page appears different from the other pages of the website. This makes the final project to lack uniformity. The choice of background color should have been harmonized to improve the final outlook of the project.

2. Trial software.

The use of trial software used to design the made some links not to work after the trial period elapses. The evaluation section of this project had such a problem. This would have been corrected by using software's that are not going to expire. This would have made all sections of the project to work as designed.

3. Font used in the project

There was lack of uniformity in the font used in some pages in the project. This made the project to lack consistency in the font used. The main reason was the website was made my single projects that combined together to make the website. This problem could have been solved by choosing a sine font for all the projects that will be combined to form the website.
