

Improvement of EDTC 6940 Final project

1. Trial software.

The use of trial software used to design the made some links not to work after the trial period elapses. The assessment section of this project had such a problem. To correct this would require the use of software's that will not expire. This would have made all sections of the project to work as designed.

2. Font used in the project

There was lack of uniformity in the font used in some pages in the project. This made the project to lack consistency in the font used. This problem could have been solved by choosing a single font to be used in the project. However, the contrast of background color was appalling and made the font used to appear well.

3. Proof reading thoroughly before posting the work

I discovered that there were some errors that could have been corrected by proof reading the work thoroughly before posting on the web. This could have been corrected by giving somebody else to proof the final draft and then corrections are done. This is critical especially for all those material that would be posted in the web as it portrays a bad image of the authors.
