

Improvement of EDTC 6950: Principles, Processes and Supervision of Networking

There was too much work in this course to be done as a summer course. All the materials were very important but I felt over rushed because it was fit in the six weeks period. Given a choice I would have liked to take the course during a normal semester so as to have time to internalize the concepts taught in the course. However the course was very resourceful especially for teachers who might end up being technology coordinators and in schools or school district.

There were so many labs with a lot of essential materials in every one of them. It made us to rush through the labs because of the time factor. It would have been better for the number of labs to be reduced so only a few will be carried out that contained the essentials principle in Networking. This would give the learners time to internalize the content of the labs and the applications. Finally the instructors in this course were very resourceful and understanding and they work with student on individual basis.
